

The taxonomic status of *Rhaebo anderssoni* (MELIN, 1941) (Anura: Bufonidae)

CÉSAR L. BARRIO-AMORÓS & SANTIAGO CASTROVIEJO-FISHER

Abstract. *Bufo anderssoni* MELIN, 1941 is synonymised with *Rhaebo guttatus* (SCHNEIDER, 1799) based on direct comparison of the holotypes of both and fresh material. All characters of the former fall within the intraspecific variation of *R. guttatus*. The few characters used in the original description to distinguish *anderssoni* from *guttatus* (narrower interorbital space, smaller tympanum and smaller size) are not considered important interspecific differences, but rather dependent on ontogenetic development.

Key words. Amphibia, *Rhaebo guttatus*, synonymy, Neotropics.

FROST et al. (2006) reviewed the taxonomic classification of the genus *Bufo* LAURENTI, 1768, and proposed the resurrection of the genus *Rhaebo* COPE, 1862 to name all the taxa included in the *Bufo guttatus* SCHNEIDER, 1799 species group (after FROST 1985; DUELLMAN & SCHULTE 1992). However, the taxonomic status of some of the species remains controversial. *Rhaebo anderssoni* (MELIN, 1941) was described based on one specimen from Taracuá, Río Uaupés, northern Brazil, under the name *Bufo anderssoni*. The species has only been mentioned in the scientific literature a few times since its description, and mainly in checklists (FROST 1985, 2006; RUIZ-CARRANZA et al. 1996; RIVERO 1961; PRAMUCK 2006; FROST et al. 2006).

MYERS & FUNKHOUSER (1951) thought *R. anderssoni* and *Rhaebo glaberrimus* (GÜNTHER, 1869 "1868") to be synonyms. RIVERO (1961) and, most recently, HOOGMOED (1990) (without examining type material; M.S. HOOGMOED, pers. comm.) considered *R. anderssoni* as a synonym of *R. guttatus* (SCHNEIDER), but this was not followed by subsequent authors (FROST 1985, 2006; FROST et al. 2006; PRAMUK 2006; RUIZ-CARRANZA et al. 1996). The status of *anderssoni* is more confusing, since ANDERSSON (1945) proposed a replacement name for the species as *B. melini*, as *Bufo anderssoni* BOULENG-

ER, 1883 (synonym of *B. stomaticus* LÜTKEN, 1862, from India) already existed. However, this suggestion was not broadly followed, because a difference of one letter (*anderssoni* vs. *andersoni*) is sufficient, sensu the ICZN (2000), to prevent homonymy.

Here we consider once more *R. anderssoni* (MELIN, 1941) as synonym of *R. guttatus* (SCHNEIDER, 1799). We have compared the holotypes of *R. anderssoni* (NHMG – Göteborgs Naturhistorika Museet– 006; Fig. 1) with several specimens of *B. guttatus* (see Appendix), including the holotype (ZMB – Zoologisches Museum der Humboldt-Universität zu Berlin– 3517; Fig 2), and all characters of the former fall within the intraspecific variation of *R. guttatus*. Indeed, the few characters MELIN (1941) stated as different from *R. guttatus* (narrower interorbital space, smaller tympanum and smaller size) are not considered important interspecific differences, but rather dependent on ontogenetic development. We consider the holotype of *R. anderssoni* to be an unsexed (we were not allowed to open the specimen) juvenile of *R. guttatus* (snout-vent length 51 mm; whereas adult females of *R. guttatus* can reach up to 189 mm, DUELLMAN 2005). We could not find a single consistent morphological character to allow differentiation between *R. anderssoni* and *R. guttatus*. The identification of

the holotype of *R. anderssoni* as a juvenile is justified on external measurements and body proportions (Table 1), color in preservative (both types have the same coloration, although the holotype of *R. guttatus* is somewhat darker) and the presence of characteristic external structures (both specimens have the same pattern in skin wart distribution, presence of a preorbital ridge, as well as hand and foot tubercles, although less conspicuously in the holotype of *R. anderssoni* which is likely a juvenile).

Rhaebo guttatus (Fig. 3) inhabits the Amazonian and Guiana Shield lowlands from French Guiana to Bolivia, east of the Andes (FROST 2006, LÖTTERS et al. 2000), and it is characterized by low interspecific variation.

Rhaebo glaberrimus is the most similar species, and was once (MYERS & FUNKHOUSER 1951) presumed to be a synonym of *R. guttatus* (as *anderssoni*); subsequent work

Tab. 1. Measurements (in mm) of the holotypes of *Rhaebo anderssoni* (NHMG 006) and *R. guttatus* (ZMB 3517). Snout-vent length (SVL); head length (from rictus to tip of snout, HL); head width (at the level of the rictus, HW); interorbital distance (IOD); eye length (EL); upper eyelid width (EW); eye to snout tip distance (ES); width of the terminal disk of the third finger (FIII); femur length (THL); tibia length (TL); foot length (FL); tympanum diameter (DT).

(CHACÓN et al. 2001; LÖTTERS et al. 2000) indicated that it is indeed a distinct species. Although there is no known case of sympatry between *R. guttatus* and *R. glaberrimus*, this could be the case along some areas of the western Andean piedmont of the Amazon in

Colombia, Ecuador, Peru or Bolivia.

Due to these evidences and following the International Code of Zoological Nomenclature (ICZN 2000), the name of the species first described –*R. guttatus* (SCHNEIDER, 1799) – has priority.

Acknowledgements

SCF thanks GÖRAN NILSON from NHMG and RAINER GÜNTHER from ZMB for kindly loaning the specimens under their care. MATS ERIKSSON from the Museum of Evolution, Zoology (Uppsala, Sweden) greatly helped in managing the loans. We thank DARREL R. FROST, MARINUS S. HOOGMOED and JUDITH MANK for their helpful comments on the MS. Two reviewers greatly improved the manuscript. The work of SCF was financed by grants from the Stiftelsen Sven och Lilly Lawskis Foundation (Sweden), the Helge Ax:son Johnsons Foundation (Sweden) and the Swedish Research Council (granted to CARLES VILÀ).
